*Oceans 2001  
November 5-8, 2001*

# Introduction

- Aerial surveys are widely used for marine mammal population census. For example,
  - Mobley et al. (1993) survey humpback stock off Hawaii
  - Carretta et al. (2000) survey for Navy operations near San Clement Island
  - Early Warning System—north right whale monitoring off U.S. Atlantic seaboard
- Motivation for using satellite imagery
  - Faster, easier, cheaper coverage in remote areas
- Results reported in this study
  - A model for detectability of marine mammals from space
  - First results from IKONOS imagery

# Commercial High Resolution Satellites

Satellite		Pan/MS resolution	
<i>Operational</i>			
IKONOS 2	Space Imaging	1 m/4 m	Launched 9/99
EROS A1	ImageSat	2 m/NA	Launched 12/00
QuickBird 2	DigitalGlobe	0.6 m/2.4 m	Launched 10/01
<i>Future launches</i>			
OrbView 3	OrbImage	1 m/4 m	
EROS B1,2	ImageSat	0.8 m/2.4 m	Launch 2003-4
IKONOS 3	Space Imaging	0.5 m/2 m	Launch 2003

# IKONOS 2 Characteristics

Panchromatic

1 m resolution

Multispectral bands

4 m resolution

Blue (B)

481 nm

Green (G)

551 nm

Red (R)

665 nm

Near IR (NIR)

805 nm

Dynamic range

11 bits

Sun synchronous orbit

10:30 equator crossing

Image size

11 km x 11 km

Revisit rate

1–3 days

# Model

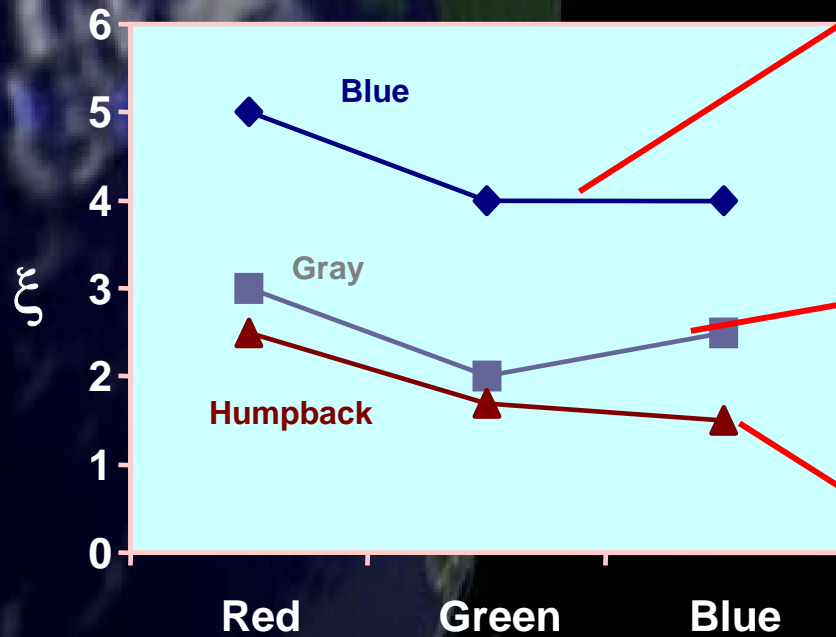

- $L_{\text{sensor}}$  = Radiance at sensor
- $L_{\text{path}}$  = Path radiance
- $L_{\text{sky}}$  = Surface sky reflection
- $L_{\text{water}}$  = Water volume scatter
- $k$  = Water attenuation
- $z$  = Target depth
- $\tau$  = Atmosphere attenuation
- $\xi$  =  $L_{\text{target}}/L_{\text{water}}$   
(Relative reflectivity)

$$L_{\text{sensor}} = L_{\text{path}} + \tau [L_{\text{sky}} + L_{\text{water}}(\xi - 1)e^{-2kz}]$$

# Relative Reflectivity ( $\xi$ )

(estimated from photographs)

A composite image featuring a view of Earth from space on the left, showing green continents and blue oceans. The right side is a dark space background with a bright star on the far right emitting a blue and white starburst, and several smaller white stars scattered across the field.

# Detection Simulations

# Detection Test

(Target injected into real data with wind wave and whitecaps)

IKONOS ocean image  
(4 spectral bands)

Simulated elliptical target,  
major axis = 14 m, minor  
axis = 3 m, downsampled  
to IKONOS MS resolution  
(4 m)

Detection  
algorithm

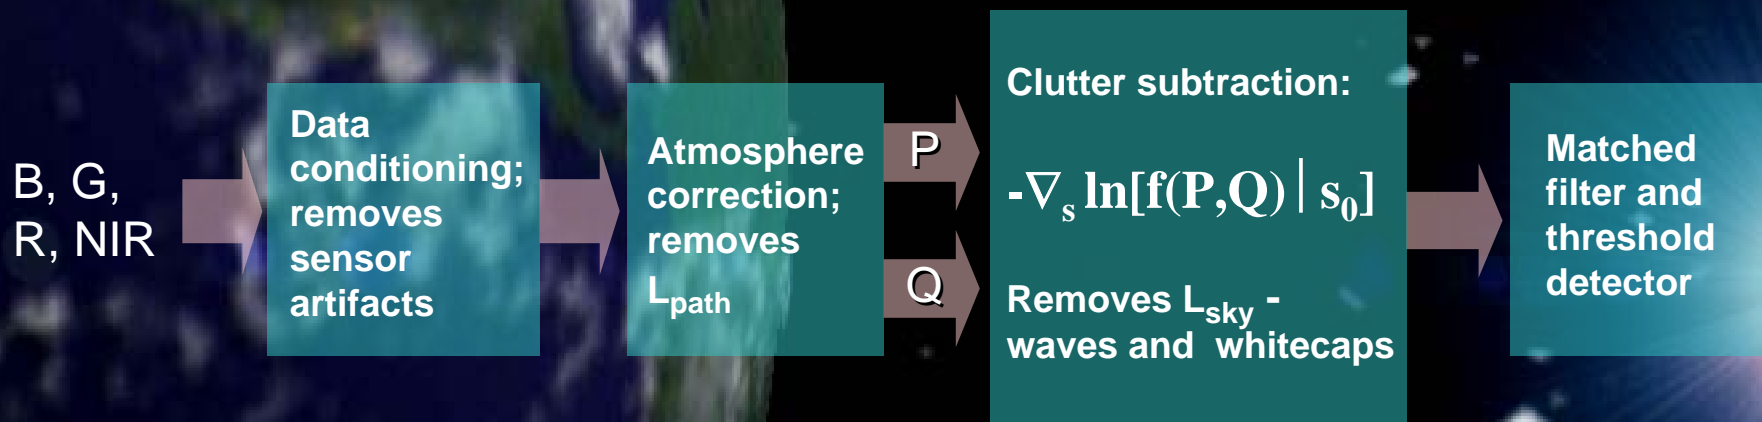

# Wavenumber Spectrum

# PQ Detection Algorithm

(for submerged targets)

	Case I	Case II, III
P = Water penetrating image =	B	B+G
Q = Surface image =	R+NIR	NIR

# Detection Example

(Simulated targets,  $\xi = 2$ , depth = 10 m)

P

Q

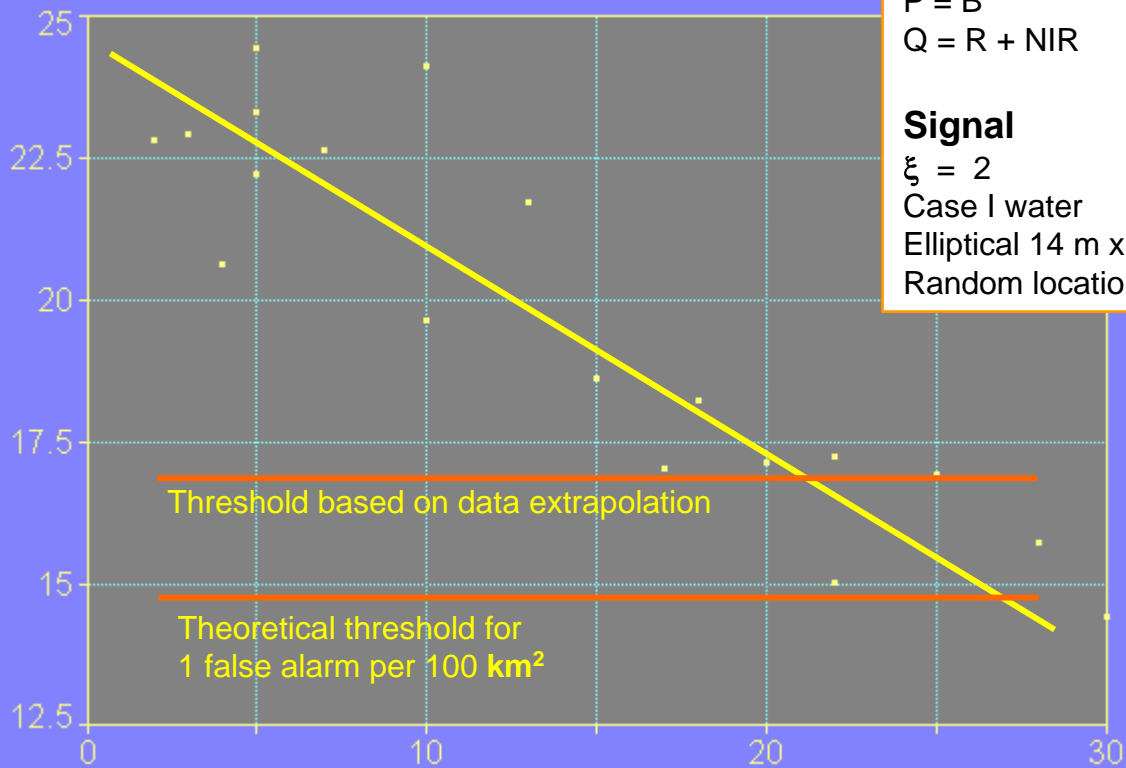

PQ Detector  
output

# Detection SNR vs Depth

(simulated targets injected into IKONOS image)

SNR (dB)

**PQ Detector**

$P = B$

$Q = R + NIR$

**Signal**

$\xi = 2$

Case I water

Elliptical 14 m x 3 m

Random locations and orientations

Depth (m)

The image is a composite. On the left side, there is a curved view of the Earth from space, showing the blue oceans, green continents, and white clouds. On the right side, the background is a dark, starry space with a bright, multi-pointed starburst or sun flare on the far right edge. The text is centered over the transition between the Earth and the starry space.

## Quick Tour

# Marine Mammals In Maui Image

SpacelMaging

# Future Plans

- **Model improvements**
  - Better spectral reflectivity measurements
- **Processing improvements**
  - SNR and FAR
- **Validation**
  - Simultaneous aircraft-satellite data collection
